

Complete EC2 Deployment Command Journey

This document lists all the important commands used while deploying a website on AWS EC2, configuring Nginx, DNS debugging, HTTPS with Certbot, and system/network verification.

1. System Update & Nginx Installation

```
1 sudo apt update
2 sudo apt upgrade -y
3 sudo apt install nginx -y
4 sudo systemctl start nginx
5 sudo systemctl enable nginx
6 systemctl status nginx
```

2. Firewall & Port Checks

```
1 sudo ss -tulpn | grep nginx
2 sudo iptables -L -n --line-numbers
```

3. Website Files & HTML

```
1 cd /var/www/html
2 sudo nano index.html
3 sudo chown -R ubuntu:ubuntu /var/www/html
```

4. DNS Debugging & Verification

```
1 nslookup myshaswat.work.gd
2 dig myshaswat.work.gd A +short
3 dig myshaswat.work.gd A @8.8.8.8 +short
4 dig @ns10.dnsexit.com myshaswat.work.gd A +short
5 dig @ns11.dnsexit.com myshaswat.work.gd A +short
6 dig @ns12.dnsexit.com myshaswat.work.gd A +short
7 dig @ns13.dnsexit.com myshaswat.work.gd A +short
```

5. Curl & Connectivity Tests

```
1 curl -I http://localhost
2 curl -I http://13.210.103.21
3 curl -I http://myshaswat.work.gd
4 curl -I https://myshaswat.work.gd
```

6. HTTPS & Certbot Setup

```
1 sudo apt install certbot python3-certbot-nginx -y
2 sudo certbot --nginx -d myshaswat.work.gd
3 sudo certbot --nginx -d myshaswat.work.gd -d www.myshaswat.work.gd
4 sudo certbot install --cert-name myshaswat.work.gd
5 sudo certbot renew --dry-run
```

7. Nginx Validation & Reload

```
1 sudo nginx -t
2 sudo systemctl reload nginx
3 sudo systemctl restart nginx
```

8. DNS Cache & System Utilities

```
1      sudo resolvectl flush-caches  
2      resolvectl statistics
```

Conclusion: This command set represents a complete real-world EC2 deployment journey including networking, DNS, HTTPS, debugging, and cost control practices.
